This total ride control solution is engineered and tested to deliver the ultimate smooth ride in a Sprinter.

Engineered for premium ride quality. This load leveling hybrid rear suspension system for the Mercedes Benz Sprinter delivers best of both worlds. Either with a heavy load or completely empty, the system delivers a superior ride quality experience. Our rear suspension is a total ride control solution. Every component has been carefully calibrated and works together to deliver the finest passenger ride quality experience.

We recalibrate the overly stiff Mercedes leaf spring package to drastically reduce harshness and jarring. Then, we add a sleeve style air spring to soften and quiet the ride and provide automatic load leveling. Our custom calibrated proprietary shock absorber is optimized for ride quality. Finally, on heavier vehicles we upgrade the anti-sway bar for stability. Ideal for limousines and passenger vans that see a dramatic change in weight. Also a perfect solution for an executive van or mobile office where a premium ride experience is required.
